➤ **Exam Name: Java SE 8 Programmer I**

➤ **Question 41 -- Question 60**

[Visit PassLeader and Download Full Version 1Z0-808 Exam Dumps](#)

**QUESTION 41**

Given the following code for the classes MyException and Test:

```
public class MyException extends RuntimeException {}

public class Test {
    public static void main(String[] args) {
        try {
            method1();
        }
        catch (MyException ne) {
            System.out.print("A");
        }
    }
    public static void method1() { // line n1
        try {
            throw Math.random() > 0.5 ? new MyException() : new RuntimeException();
        }
        catch (RuntimeException re) {
            System.out.print("B");
        }
    }
}
```

What is the result?

- A. A
- B. B
- C. Either A or B
- D. A B
- E. A compile time error occurs at line n1

**Answer: B**

**Explanation:**

"catch (RuntimeException re)" always catches a RuntimeException.

**QUESTION 42**

Given:

```
public class App {  
  
    String myStr = "7007";  
  
    public void doStuff(String str) {  
        int myNum = 0;  
        try {  
            String myStr = str;  
            myNum = Integer.parseInt(myStr);  
        } catch (NumberFormatException ne) {  
            System.err.println("Error");  
        }  
        System.out.println(  
            "myStr: " + myStr + ", myNum: " + myNum);  
    }  
  
    public static void main(String[] args) {  
        App obj = new App();  
        obj.doStuff("9009");  
    }  
}
```

What is the result?

- A. myStr: 9009, myNum: 9009
- B. myStr: 7007, myNum: 7007
- C. myStr: 7007, myNum: 9009
- D. Compilation fails

**Answer: C**

**QUESTION 43**

Which two are benefits of polymorphism?

- A. Faster code at runtime
- B. More efficient code at runtime
- C. More dynamic code at runtime
- D. More flexible and reusable code
- E. Code that is protected from extension by other classes

**Answer: BD**

**Explanation:**

<https://www.cs.princeton.edu/courses/archive/fall98/cs441/mainus/node5.html>

**QUESTION 44**

Given the code fragment:

```
int nums1[] = new int[3];  
int nums2[] = {1, 2, 3, 4, 5};  
nums1 = nums2;  
for (int x : nums1){  
    System.out.print(x + ":");  
}
```

What is the result?

- A. 1:2:3:4:5:
- B. 1:2:3:
- C. Compilation fails.
- D. An ArrayOutOfBoundsException is thrown at runtime.

**Answer: A**

**QUESTION 45**

Given:

```
public class Product {  
    int id;  
    String name;  
    public Product(int id, String name) {  
        this.id = id;  
        this.name = name;  
    }  
}
```

And given the code fragment:

```
4. Product p1 = new Product(101, "Pen");  
5. Product p2 = new Product(101, "Pen");  
6. Product p3 = p1;  
7. boolean ans1 = p1 == p2;  
8. boolean ans2 = p1.name.equals(p2.name);  
9. System.out.print(ans1 + ":" + ans2);
```

What is the result?

- A. true:true
- B. true:false
- C. false:true
- D. false:false

**Answer: C**

**QUESTION 46**

Given the following classes:

```
public class Employee {  
    public int salary;  
}  
  
public class Manager extends Employee {  
    public int budget;  
}  
  
public class Director extends Manager {  
    public int stockOptions;  
}
```

And given the following main method:

```
public static void main(String[] args) {  
    Employee employee = new Employee();  
    Manager manager = new Manager();  
    Director director = new Director();  
    //line n1  
}
```

Which two options fail to compile when placed at line n1 of the main method?

- A. employee.salary = 50\_000;
- B. director.salary = 80\_000;
- C. employee.budget = 200\_000;
- D. manager.budget = 1\_000\_000;
- E. manager.stockOption = 500;
- F. director.stockOptions = 1\_000;

**Answer: CE**

**Explanation:**

C. budget is not a member of class employee.

E. stockOptions is not a member of class manager.

#### **QUESTION 47**

Given:

```
class Product {
    double price;
}

public class Test {
    public void updatePrice(Product product, double price) {
        price = price * 2;
        product.price = product.price + price;
    }
    public static void main(String[] args) {
        Product prt = new Product();
        prt.price = 200;
        double newPrice = 100;

        Test t = new Test();
        t.updatePrice(prt, newPrice);
        System.out.println(prt.price + " : " + newPrice);
    }
}
```

What is the result?

- A. 200.0 : 100.0
- B. 400.0 : 200.0
- C. 400.0 : 100.0
- D. Compilation fails.

**Answer: C**

**Explanation:**

After call to updatePrice prt.price change its value to 400 (prt is passed by reference)  
variable newPrice never changes its value from 100 (newPrice is passed by value)

**QUESTION 48**

Given the code fragment:

```
if (aVar++ < 10) {
    System.out.println(aVar + " Hello World!");
} else {
    System.out.println(aVar + " Hello Universe!");
}
```

What is the result if the integer aVar is 9?

- A. Hello World!
- B. Hello Universe!
- C. Hello World
- D. Compilation fails.

**Answer: A**

**QUESTION 49**

Given the code fragment:

```
public static void main(String[] args) {  
    String date = LocalDate  
        .parse("2014-05-04")  
        .format(DateTimeFormatter.ISO_DATE_TIME);  
    System.out.println(date);  
}
```

What is the result?

- A. May 04, 2014T00:00:00.000
- B. 2014-05-04T00:00: 00. 000
- C. 5/4/14T00:00:00.000
- D. An exception is thrown at runtime.

**Answer: D**

**Explanation:**

The exception `java.time.temporal.UnsupportedTemporalTypeException` is thrown at runtime. We should use class `LocalDateTime` with `ISO_DATE_TIME` format or use the format `ISO_DATE` to avoid the exception. See `ISO_DATE_TIME` at <https://docs.oracle.com/javase/8/docs/api/java/time/format/DateTimeFormatter.html> See examples at <https://gist.github.com/mscharhag/9195718>

#### QUESTION 50

Given the code fragment:

```
public static void main(String[] args) {  
    short s1 = 200;  
    Integer s2 = 400;  
    Long s3 = (long) s1 + s2;           //line n1  
    String s4 = (String) (s3 * s2);    //line n2  
    System.out.println("Sum is " + s4);  
}
```

What is the result?

- A. Sum is 600
- B. Compilation fails at line n1.
- C. Compilation fails at line n2.
- D. A `ClassCastException` is thrown at line n1.
- E. A `ClassCastException` is thrown at line n2.

**Answer: C**

**Explanation:**

Compilation fails at n2 because the compiler cannot cast long to String.

#### QUESTION 51

What is the name of the Java concept that uses access modifiers to protect variables and hide them within a class?

- A. Encapsulation

- B. Inheritance
- C. Abstraction
- D. Instantiation
- E. Polymorphism

**Answer: A**

**Explanation:**

Using the private modifier is the main way that an object encapsulates itself and hide data from the outside world.

[http://www.tutorialspoint.com/java/java\\_access\\_modifiers.htm](http://www.tutorialspoint.com/java/java_access_modifiers.htm)

**QUESTION 52**

Given the code fragment:

```
abstract class Planet {  
    protected void revolve() {                //line n1  
    }  
  
    abstract void rotate();                    //line n2  
}  
  
class Earth extends Planet {  
    void revolve() {                            //line n3  
    }  
  
    protected void rotate() {                  //line n4  
    }  
}
```

Which two modifications, made independently, enable the code to compile?

- A. Make the method at line n1 public.
- B. Make the method at line n2 public.
- C. Make the method at line n3 public.
- D. Make the method at line n3 protected.
- E. Make the method at line n4 public.

**Answer: CD**

**Explanation:**

We can't assign weaker privileges in a subclass.

Method revolve() is declared protected in class Planet.

We can declare revolve() as public or protected in class Earth.

**QUESTION 53**

Given:

```
class Vehicle {
    String type = "4W";
    int maxSpeed = 100;

    Vehicle(String type, int maxSpeed) {
        this.type = type;
        this.maxSpeed = maxSpeed;
    }
}

class Car extends Vehicle {
    String trans;

    Car(String trans) {           //line n1
        this.trans = trans;
    }

    Car(String type, int maxSpeed, String trans) {
        super(type, maxSpeed);
        this(trans);             //line n2
    }
}
```

And given the code fragment:

```
7. Car c1 = new Car("Auto");
8. Car c2 = new Car("4W", 150, "Manual");
9. System.out.println(c1.type + " " + c1.maxSpeed + " " + c1.trans);
10. System.out.println(c2.type + " " + c2.maxSpeed + " " + c2.trans);
```

What is the result?

- A. 4W 100 Auto  
4W 150 Manual
- B. Null 0 Auto  
4W 150 Manual
- C. Compilation fails only at line n1
- D. Compilation fails only at line n2
- E. Compilation fails at both line n1 and line n2

**Answer: E**

**Explanation:**

Compilation fails at n1 because Vehicle hasn't a default constructor

Compilation fails at n2 because this() must be the first statement in constructor body

#### **QUESTION 54**

Given the code fragment:

```
1. class X {  
2.     public void printFileContent() {  
3.         /* code goes here */  
4.         throw new IOException();  
5.     }  
6. }  
7. public class Test {  
8.     public static void main(String[] args) {  
9.         X xobj = new X();  
10.        xobj.printFileContent();  
11.    }  
12. }
```

Which two modifications should you make so that the code compiles successfully?

- ☐ A) Replace line 8 with `public static void main(String[] args) throws Exception {`
- ☐ B) Replace line 10 with:

```
try {  
    xobj.printFileContent();  
}  
catch(Exception e) { }  
catch(IOException e) { }
```
- ☐ C) Replace line 2 with `public void printFileContent() throws IOException {`
- ☐ D) Replace line 4 with `throw IOException("Exception raised");`
- ☐ E) At line 11, insert `throw new IOException();`

- A. Option A
- B. Option B
- C. Option C
- D. Option D
- E. Option E

**Answer: AC**

**Explanation:**

Add throws clause in both printFileContent and main.

#### **QUESTION 55**

Given the following two classes:

```
public class Customer {  
    ElectricAccount acct = new ElectricAccount();  
  
    public void useElectricity(double kWh) {  
        acct.addKWh(kWh);  
    }  
}  
  
public class ElectricAccount {  
    private double kWh;  
    private double rate = 0.07;  
    private double bill;  
  
    //line n1  
}
```

How should you write methods in the ElectricAccount class at line n1 so that the member variable bill is always equal to the value of the member variable kWh multiplied by the member variable rate? Any amount of electricity used by a customer (represented by an instance of the customer class) must contribute to the customer's bill (represented by the member variable bill) through the method useElectricity method.

An instance of the customer class should never be able to tamper with or decrease the value of the member variable bill.

- ☐ A) 

```
public void addKWh(double kWh) {  
    this.kWh += kWh;  
    this.bill = this.kWh*this.rate;  
}
```
- ☐ B) 

```
public void addKWh(double kWh) {  
    if (kWh > 0){  
        this.kWh += kWh;  
        this.bill = this.kWh * this.rate;  
    }  
}
```
- ☐ C) 

```
private void addKWh(double kWh) {  
    if (kWh > 0) {  
        this.kWh += kWh;  
        this.bill = this.kWh*this.rate;  
    }  
}
```
- ☐ D) 

```
public void addKWh(double kWh) {  
    if(kWh > 0) {  
        this.kWh += kWh;  
        setBill(this.kWh);  
    }  
}  
  
public void setBill(double kWh) {  
    bill = kWh*rate;  
}
```

- A. Option A  
B. Option B  
C. Option C  
D. Option D

**Answer: D**

**QUESTION 56**

Given the code fragments:

Person.java:

```
public class Person {
    String name;
    int age;

    public Person(String n, int a) {
        name = n;
        age = a;
    }

    public String getName() {
        return name;
    }

    public int getAge() {
        return age;
    }
}
```

Test.java:

```
public static void checkAge(List<Person> list, Predicate<Person> predicate) {
    for (Person p : list) {
        if (predicate.test(p)) {
            System.out.println(p.name + " ");
        }
    }
}

public static void main(String[] args) {
    List<Person> iList = Arrays.asList(new Person("Hank", 45),
                                       new Person("Charlie", 40),
                                       new Person("Smith", 38));

    //line n1
}
```

Which code fragment, when inserted at line n1, enables the code to print Hank?

- A. `checkAge (iList, ( ) -> p. get Age ( ) > 40);`
- B. `checkAge(iList, Person p -> p.getAge( ) > 40);`
- C. `checkAge (iList, p -> p.getAge ( ) > 40);`
- D. `checkAge(iList, (Person p) -> { p.getAge() > 40; });`

**Answer: C**

**Explanation:**

<https://docs.oracle.com/javase/tutorial/java/javaOO/lambdaexpressions.html>

**QUESTION 57**

Given the code fragment:

```
public static void main(String[] args) {  
    String[][] arr = {"A", "B", "C"}, {"D", "E"};  
    for (int i = 0; i < arr.length; i++) {  
        for (int j = 0; j < arr[i].length; j++) {  
            System.out.print(arr[i][j] + " ");  
            if (arr[i][j].equals("B")) {  
                break;  
            }  
        }  
        continue;  
    }  
}
```

What is the result?

- A. A B C
- B. A B C D E
- C. A B D E
- D. Compilation fails.

**Answer: C**

**QUESTION 58**

Given the code fragment:

```
public static void main(String[] args) {  
    String str = " ";  
    str.trim();  
    System.out.println(str.equals("") + " " + str.isEmpty());  
}
```

What is the result?

- A. true true
- B. true false
- C. false false
- D. false true

**Answer: C**

**QUESTION 59**

Given:

```
class CD {
    int r;
    CD(int r) {
        this.r=r;
    }
}

class DVD extends CD {
    int c;
    DVD(int r, int c) {
        // line n1
    }
}
```

And given the code fragment:

```
DVD dvd = new DVD(10,20);
```

Which code fragment should you use at line n1 to instantiate the dvd object successfully?

- ☐ A) `super.r = r;`  
    `this.c = c;`
- ☐ B) `super(r);`  
    `this(c);`
- ☐ C) `super(r);`  
    `this.c = c;`
- ☐ D) `this.c = r;`  
    `super(c);`

- A. Option A
- B. Option B
- C. Option C
- D. Option D

**Answer: C**

**QUESTION 60**

Given the code fragment:

```
int a[] = {1, 2, 3, 4, 5};
for(XXX) {
    System.out.print(a[e]);
}
```

Which option can replace xxx to enable the code to print 135?

- A. `int e = 0; e <= 4; e++`
- B. `int e = 0; e < 5; e += 2`
- C. `int e = 1; e <= 5; e += 1`

D. `int e = 1; e < 5; e += 2`

**Answer: B**

**Explanation:**

This loop prints the array elements with index 0, 2 and 4.

These elements are 1, 3, 5.
